

光励起発光分光法による単層カーボンナノチューブ熱伝導率の解析

研究推進機構 総合研究院 ナノカーボン研究部門

► 研究概要 ⇒ 単層カーボンナノチューブの基礎物性評価と応用

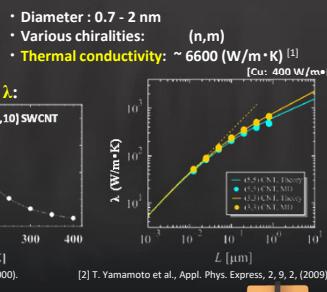

Introduction

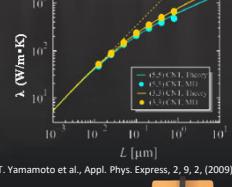

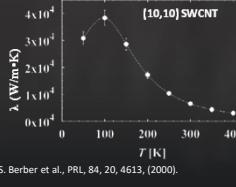

Background in theory

Single-walled carbon nanotube (SWCNT):

Properties @ room temperature

Thermal conductivity λ :

Objective

- For chirality-assigned, length fixed
and isolated SWCNT @ room temperature
- Observe the temperature distribution by non-contact optical measurement
 - Measure the structural dependence of thermal conductivity (Chirality, length, defect, ...)

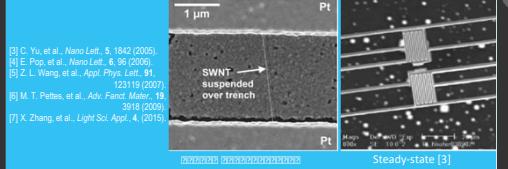

Background in experimental

Thermal conductivity of individual SWCNT

@ room temperature

Previous work	λ (W/m·K)	(n, m)	D (nm)	Method
Yu (2005) ^[3]	3270 - 9800	×	1 - 3	Steady-state
Pop (2006) ^[4]	3500	×	1.7	Joule-heating
Wang (2007) ^[5]	4700	×	1.9	3ω, AFM assign
Petters (2009) ^[6]	600	(22,12)	1.5	Steady-state, TEM assign
X. Zhang (2015) ^[7]	2500 - 3800	(18,15)	2.24	Light absorption, TEM assign

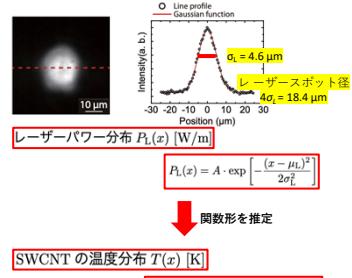

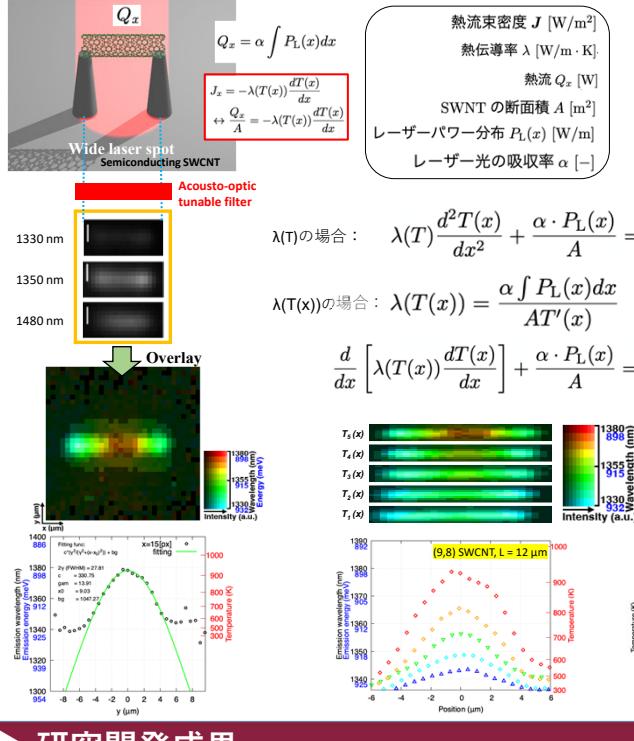

Thermal conductivity λ , Diameter D.

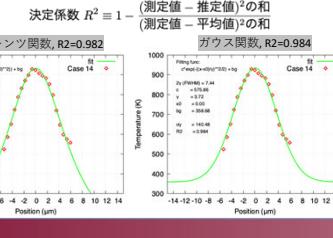

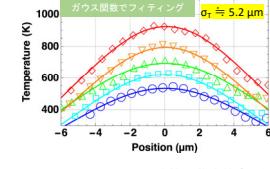

Few studies evaluated SWCNT structure.

Results & Discussion

Photoluminescence (PL) image spectroscopy

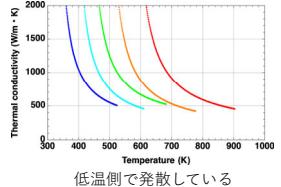

$$T(x) \equiv B \cdot \exp \left[-\frac{(x - \mu_T)^2}{2\sigma_T^2} \right]$$

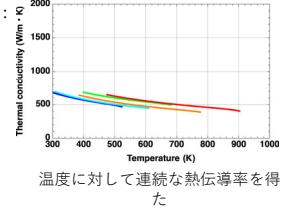

実験で得られた離散的な温度分布をフィティングにより補い熱伝導方程式を解いた

$\lambda(T)$ の場合 :

$\lambda(T(x))$ の場合 :

Conclusion

We have demonstrated the possibility of clarifying the temperature dependence of the thermal conductivity of SWCNTs by this method.
